NEW VIRUS IDENTIFIED: WAREZOV/STRATION WORM

The <u>FBI</u> has become aware of a worm identified as Warezov/Stration Worm circulating as a spam e-mail quickly and effectively across the Internet. The spam e-mail claims the e-mail recipient's computer/IP address has been identified for malicious activity online. An attachment to the e-mail is purportedly a software used to clean the recipient's machine. This attached executable is the Trojan downloader portion of the worm itself.

A worm is identified as a program that duplicates itself over a computer network and typically performs malicious actions.

This worm or virus is unique in the quickness in which it is spreading. Upon infection, a machine will download and install a number of executables. Once the executables have been installed, an infected machine will begin conducting Domain Name Service (<u>DNS</u>) queries to look for open mail proxies. The infected machine then begins spamming mail containing a social engineering attack along with a Stration trojan downloader attachment.

IF YOU RECEIVE A SUSPICIOUS E-MAIL WITH A FILE ATTACHED, DO NOT DOWNLOAD THE ATTACHMENT ASSOCIATED WITH THE E-MAIL. IF YOU RECEIVE THIS E-MAIL OR AN E-MAIL SIMILAR TO THIS, DELETE THE MESSAGE AND DO NOT OPEN THE ATTACHMENT.
